

Series Temporales

1B 2024 Sergio Hinojosa

Dataset

Ventas al mercado interno de Producción Nacional de Vino en miles de hectolitros

Frecuencia de actualización: Mensual

Unidades: Miles de hectolitros

322 muestras

Dataset

Intervalo de 5 años

Diferenciación

Diferenciación

Diferenciación a 12 pasos

Tendencia lineal

Tendencia lineal

Estacionareidad

Test de Dickey-Fuller

```
Estadístico -4.318932
p-valor 0.000412
Lags usados 17.000000
Observaciones usadas 304.000000
Valor del umbral (1%) -3.452045
Valor del umbral (5%) -2.871095
Valor del umbral (10%) -2.571861
```

El estadístico es menor que los 3 umbrales, por lo tanto puedo rechazar la hipótesis nula. Por otro lado, el p-valor es muy chico. Según este test la serie diferenciada es ESTACIONARIA.

Estacionareidad

Test KPSS

```
Estadístico 0.040966
p-valor 0.100000
Lags usados 7.000000
Valor del umbral (10%) 0.347000
Valor del umbral (5%) 0.463000
Valor del umbral (2.5%) 0.574000
Valor del umbral (1%) 0.739000
```

En este caso el p-valor no es significativamente chico por lo que no puedo rechazar el test, puedo asumir entonces que la serie es ESTACIONARIA.

Ambos test dan indicio que la serie es ESTACIONARIA.

p = 1, q = 2, d = 0

Log Likelihood -1900.638

AIC 3811.276

BIC 3830.148

Ljung-Box (L1) (Q) 0.03

Prob(Q) 0.86

Predicción

Analisís espectral

Log Likelihood -1700.961

AIC 3421.922

BIC 3459.288

Ljung-Box (L1) (Q) 0.02

Prob(Q) 0.89

Predicción

Análisis de residuos

Ljung-Box (L1) (Q) 0.02

Prob(Q) 0.89

```
# Set parameter range
p = range(1,4)
q = range(1,4)
d = range(0,2)
s = [12]
pdq = list(product(p, d, q))
seasonal pdg = list(product(p, d, q, s))
# Create SARIMA model for each order and seasonal order
aics = []
for order in pdg:
    for seasonal order in seasonal pdq:
        try:
            model = ARIMA(serie, order=order, seasonal order=seasonal order)
            results = model.fit()
            if results.llf != 0:
